

Different sources of water

Analyzing different types of water and its cost, Ray Water has a very advantageous position over others. We detected a very important market, the largest in the world, treated water and bottled, over 45 billion euros with a consumption of more than 115,000,000 cubic meters in 2006 (www.bottledwater.org) because it guarantees quality, hygiene and health to the consumers.

We are also manufacturing very pure water through a natural cycle, artificially created in our machines. Furthermore, water while passing through the circuit specifically designed in Ray Technology Water, is purified automatically. The result is a pure water of low mineralization that you can remineralize later on demand.

Water Ray Agua technology' cost is lower than those treated and bottled. The use of our equipment, considering amortization and maintenance, is more economical.
